

Development

With the software projects and software tools available from [open source](#) [1], we don't have to reinvent the wheel or pay excessive royalties so the development of custom information technology has become affordable.

Projects

We support custom projects and many of the projects available at [Source Forge](#) [2] and other open source sites. Let us know if there is a particular project you are interested in applying.

Tools

We use many of the open source software tools available as Source Forge, [GNU](#) [3] and other open source sites. If the project you are interested in needs a particular tool let us know because it is very possible we already support it or can add it to what we support.
